TITLE: AI-POWERED VIRTUAL ETHICAL DILEMMA SOLVER

TEAM MEMBERS: Ruthrapriyan p, Niranjana H, Deepika R

BATCH NUMBER: 25BAD012

ABSTRACT

In the intricate realm of contemporary banking and finance, making ethical decisions is crucial yet difficult. The AI-driven Virtual Ethical Dilemma Solver is a sophisticated system intended to help professionals analyze and resolve ethical dilemmas by utilizing cutting-edge Natural Language Processing (NLP) techniques. This initiative uses the all-MiniLM-L6-v2 transformer model to semantically interpret and categorize ethical situations into three groups: Ethical, Unethical, and Ethically Ambiguous.

The model produces high-dimensional embeddings from the input text, which are subsequently processed by a machine learning classifier to ascertain the ethical status of a particular scenario. The system also delivers an ethics score, contributing factors, a detailed reasoning analysis, and future ramifications, providing actionable suggestions to improve ethical decision-making. An easy-to-use Streamlit interface facilitates case management, report creation, and result visualization. By merging AI with ethical frameworks, this solution strives to reduce reputational and regulatory risks, enhance transparency, and assist compliance within the financial sector.
